

ROUND 3

ANALYTICAL REPORT

Public Reaction to a Trending Social Issue

Project focus: Cybercrime and Digital Exclusion

PROJECT SNAPSHOT	VALUE
Raw rows across two batches	400
Unique URLs after deduplication	234
Shared URLs	166
Dataset 1 only / Dataset 2 only	34 / 34
Suspicious publication dates	2

Source: Google News RSS
Collection date: 21 September 2026 (UTC)

Executive Summary

The two collection batches contained 234 rows before deduplication and 234 unique URLs after URL-based deduplication. The two batches shared 166 URLs. Model predictions were generated from article title and summary text.

1. Data Collection Method

Articles were collected through Google News RSS in two batches. The available fields include title, summary, URL, published_at, collected_at, source, and search_category. The loaded Round 2 sentiment and topic pipelines were applied to article text.

2. Collection Window and Overlap

Batch	Rows	Collection time (UTC)
Dataset 1	200	21 Sep 2026, around 02:59:38
Dataset 2	200	21 Sep 2026, around 07:48:20

The median collection-time gap among shared URLs was 4.812 hours. The batches are overlapping collections, not independent samples or continuous monitoring.

3. Sentiment Analysis

Predicted sentiment	Count	Percent
Neutral	211	90.17%
Negative	20	8.55%
Positive	3	1.28%

Interpretation: the classifier predominantly labelled article text as Neutral. These labels describe the collected news text and do not directly measure public opinion.

4. Topic Analysis

Predicted topic	Count	Percent
Community_Discussion	230	98.29%
Technical_Issues	2	0.85%
Account_Security	1	0.43%
Feature_Feedback	1	0.43%

The strong concentration in Community_Discussion may reflect the classifier's learned categories or the wording of collected articles. Topic labels should be validated before making detailed claims about subject matter.

5. Exploratory Keyword Analysis

Keyword tag	Article matches
Digital_Exclusion	118
Cybercrime	91
No_Keyword_Match	19
Online_Fraud	7

Keyword tags are exploratory text matches. A single article may match multiple tags, so tag counts can overlap and should not be summed as unique article totals.

6. Source Analysis

Source	Articles
coe.int	11
Nature	8
Interpol	5
Bhaskar English	4
United Nations Office on Drugs and Crime	4
Frontiers	4
The Hindu	4
Deccan Herald	3

Source	Articles
The World Economic Forum	3
Cybercrime Magazine	2

7. News Activity Analysis

232 articles had publication dates from 2000 onward and were retained for date-based analysis. 2 rows were excluded from the publication timeline because their dates were missing or suspicious.

The busiest observed publication date in this cleaned subset was 2026-09-15, with 15 articles.

This is news publication activity, not social-media engagement. No likes, comments, shares, or views were available to confirm an engagement spike.

8. Topic Examples / Entities

Examples below are drawn from the collected article titles. They illustrate the content covered; they are not a validated named-entity recognition result.

Community_Discussion

- Parliamentary committee report highlights discrepancies in NCRB data: Cybercrime complaints reached 5.4 mil... - Bhaskar English — Bhaskar English
- Meta to report child safety cases to cybercrime portal - Deccan Herald — Deccan Herald
- As cyber fraud grows, J&K; Police steps up public awareness - Greater Kashmir — Greater Kashmir

Account_Security

- Raipur Cybercrime: Kids Gaming Leads To Bank Account Fraud | Expert Tips - Bhaskar English — Bhaskar English

Technical_Issues

- Global cybercrime crackdown: over 373 000 dark web sites shut down - Europol — Europol
- The true measure of digital inclusion is how effectively people use opportunities offered - Down To Earth — Down To Earth

Feature_Feedback

- Winner Announcement for Cyber Smart Idea Challenge Building a Cybercrime – free Digital Bharat - MyGov Blogs — MyGov Blogs

9. Trigger Explanations

The collected articles can provide context about cybercrime and digital exclusion, but this dataset alone does not establish that a particular event caused a sentiment change. Both batches had identical overall sentiment percentages, and the shared articles were collected about 4.812 hours apart. No two sentiment shifts are demonstrated by the current results.

Any event discussed as a possible trigger must be presented as context or a hypothesis, not a confirmed cause, unless supported by additional time-stamped observations and independent evidence.

10. Data Quality and Limitations

Check	Result
Raw rows	400
Unique URLs	234
URLs shared by both batches	166
Dataset 1-only / Dataset 2-only	34 / 34
Suspicious/invalid publication dates	2

Limitations: RSS articles are not social posts; article counts are not engagement counts; batches overlap; model predictions may contain classification errors; two publication timestamps were suspicious 1970 dates; and the data does not support causal trigger claims or two verified sentiment shifts.

11. Conclusion

The dataset provides a snapshot of news coverage associated with the project's cybercrime and digital-exclusion focus. The analysis summarizes predicted sentiment, predicted topics, keyword matches, sources, and publication activity. Further repeated collection, manual label validation, reliable timestamps, and platform-level interaction data would be required to assess social reaction over time and verify engagement spikes or sentiment shifts.
